                                                                                                                                                                                                                                                         ö
                                                                                   to modulate expression of a gene in a plant, mammalian, bacterial or fungal cell. They are used to cleave a separate nucleic acid, preferably RNA. The nucleic acids are used to inhibit gene expression and/or cell proliferation, and can be used to intend a disease or condition. More than one nucleic acid can be independently targeted to the same or different sites in a cell. The nucleic acids may be used to study DNA. The modifications to the nucleic acids optimises their catalytic activity and can maintain or enhance their activity. They exhibit a high degree of specificity for RNA. The present sequence represents the coding sequence of deoxyribozyme #8 used in the method of the invention.
                                                    The invention relates to nucleic acid molecules with endonuclease activity, which are particularly useful for cleavage of RNA or DNA. The nucleic acids are used in a pharmaceutical composition and are used
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                         Deoxyribozyme; cytostatic; endonuclease; RNA cleavage; DNA cleavage; gene therapy; plant; fungus; bacteria; mammal; ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acids with endonuclease activity, such as ribozymes and nucleozymes, for modulating gene expression in a plant, mammalian,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a "Forms double-stranded region with bases 15 to 8 of AAS12374"
nucleozymes, for modulating gene expression in a plant, mammalian,
bacterial or fungal cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S

                                                             The invention relates to nucleic acid molecules with endonuclease activity, which are particularly useful for cleavage of RNA or DNA. The nucleic acids are used in a pharmaceutical composition and are used to modulate expression of a gene in a plant, mammalian, bacterial or fungal cell. They are used to cleave a separate nucleic acid, preferably FNA. The nucleic acids are used to inhibit gene expression and/or cell proliferation, and can be used to inhibit gene expression and/or cell proliferation, and can be used to inhibit argeted to the same or than one nucleic acid can be independently targeted to the same or different sites in a cell. The nucleic acids may be used to study DNA. The modifications to the nucleic acids optimises their catalytic activity and can maintain or enhance their activity. They exhibit a high degree of specificity for RNA. The present sequence represents the class IV ribosyme, used in an example which demonstrates the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a vector (a pGA construct) comprising a termination sequence coding for the lambda TO terminator, a prokaryotic origin of replication, a selectable marker gene and a eukaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TO; ds; terminator; pGA, DNA vaccine; anti-HIV; virucide; Human Immunodeficiency Virus; HIV; Gaq; HIV gpl20; HIV Pol; HIV Env; HIV VLP; measles fusion protein; measles hacmagglutinin; CMV; adaptor; measles nucleoprotein; influenza hacmagglutinin; C3d gene; cell-mediated immune response; humoral immune response; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel pGA vector useful for immunising patient against measles, influenza has termination sequence encoding lambda TO terminator and a eukaryotic transcription cassette with vaccine insert encoding immunogens of pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

transcription cassette comprising a vaccine insert encoding one or more immunogens derived from a pathogen e.g. Human Immunodeficiency Virus (HIV) 6a9. HIY gpl20, HIV PO1, HIV EDV. HIV VLP, or its mutants, measles (Lusion protein, measles haemagglutinin, measles nucleoprotein, influenza haemagglutinin, or its mutants, or subsequences, and optionally at least one C3d gene, is useful for immunising or treating a patient, when administered by an intramuscular or intradermal route. The immunisation methods using pGA elicit both cell-mediated and humoral immune responses that may limit the infection, spread or growth of the pathogen and result in protection against subsequent challenge against the pathogen. The terminator sequence present prevents read-through from the Kanamycin cassette into vaccine sequences while the plasmid is being produced in bacteria. Prevention of transcriptional read-through stabilises vaccine in the case of the plasmid is being produced in the case of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      can be recognised by bacterial endonucleases. Shoshan A,

Faigler S; Mintz L, Mintz E, Wasserman A, WPI; 2002-257383/30. New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-specific genes

Example 1; SEQ ID 20491; 47pp; English.

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants.

```
The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minilibraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue- and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering
                                                                                                                                                                                                                                                                                                                                                                 from a particular disorder. ABN27253 to ABN59589 meet a particular disorder. ABN27253 to ABN59589 meet a particular disorder. ABN27253 to ABN59589 meet a particular disorder. Abne and mice, which are used in the exemplification of the present invention.

N.B. The sequence data for this partent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch -

Example 5; Fig 29; 300pp; English.

oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and The present invention describes a method (M1) for designing capture

```
Experimental particular series of the parasitic infections carries, present virus and polio virus, and parasitic infections carries selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BrCA1 gene, buman papillomavirus types 16 and 18 and 11ver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonuclectide probe sets occurred and correlating (using e sets occurred and correlating (using ecomputes) identified ligation to a presence or absence of the target nucleotide sequences. ABISE2074 to ABISE2074 correlating computes used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch - \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; K-ras; PCR primer; probe; capture probe; mutation detection, ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

```
Epstein Barr Virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amphilitation, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAl gene, buman papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the cancer stees and identifying if ligation of the oligonuclectide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nuclecitie sequences. AB182074 to AB197646 represent oligonuclectide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method (MI) for designing capture obligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Carptococcus neoformans, Candida albicans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch -

New staphylococcal protein A variant, useful for treating diabetes and rheumatoid arthritis, exhibits binding specificity for immunoglobulin-Fab domain and comprises variations in amino acid sequence of staphylococcal protein. A domain D  $\,$ 

Example 12; Page 58; 88pp; English.

The invention relates to staphylococcal protein A (SpA) variants which exhibit altered binding specificity for an immunoglobulin Fab (Ig-FAb) fragment relative to native SpA. The SpA variants of the invention have one or more amino acid substitution in the SpA VH3 Ig-Fab binding region

```
ó
            Inducers of autoreactive B cell, leukaemic or lymphoma cell apoptosis or anergy. The SpA variants of the invention are useful for detecting the presence of a certain Ig-Fab-expressing lymphocyte subset in a sample of lymphocytes. The SpA variants may therefore be used in the diagnosis of some forms of leukaemia. The SpA variants may also be administered to an individual with an abnormally high number of a certain lymphocyte subset to reduce the number of that lymphocyte subset. The SpA variants are also useful for purifying monoclonal or polyclonal antibodies from serum, plasma, tissue culture or other sources. The SpA variants that exhibit enhanced clan VH3-specific effects in vitro or in vivo, such as
                                                                                                                                                                                                                                                                                                                                                                    deletion by other mechanisms. By engineering the interaction between Spa variants and Ig-Fab according to the invention, variant Spa with specially tailored Fab-binding specificities can be selected that target pathogenic neoplastic B cell populations or autoreactive B-cell clones. The Spa variants are therefore useful for treating conditions that are linked to disease associated B-cells such as idiopathic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ig-expressing B cells in vivo compared with targetting using a specific antigen. Sequences AACR3732-C87378 represent nucleic acid sequences used in the construction of a randomised SpA domain D library in an exemplification of the invention. Sequences AAC87375-C87378 represent
                                                                                                                                                                                                                                                  the ability to delete undesirable neoplastic B-cells or pathogenic B-cells that are responsible for the production of disease-causing autoantibodies, are useful as therapeutic agents. Therapeutic SpA variants that can bind to Fab on the B-cell receptor of an autoreactive B-cell or leukaemic or lymphoma cell can induce anergy, apoptosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ligase detection reaction, LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              thrombocytopenia, rheumatoid arthritis, systemic lupus erythematosus (SLE), autoimmune thyroiditis, or diabetes. Engineered B cell superantigens (such as the SpA variants of the invention) bind to immunoglobulin receptors on B-cells in a manner that is distinct from
SpA domain D) relative to the native SpA. The SpA variants are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antigen binding by antibodies. Therefore, the SpA variants which have superantigen properties can target much larger populations of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; K-ras; PCR primer; probe; capture probe; mutation detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                              Oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by hacterial infectious agents of cryptococcus neoformans, Candida ablicans and hapergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents of selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, foreignes and the food method is also used for environmental monitoring, foreignes and the food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                   and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonuclectide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PD-ATP-binding cassette; PD-ABC; chromosome 19p13.3; spleen; thymus; ss; peripheral blood leukocyte; bone marrow; lymph node; dyslipidaemia; cardiovascular disorder; inflammatory disorder; abnormal calcium flux; epilepsy; coronary artery disease; Tangier's disease; atherosclerosis; familial high-density liopportein deficiency; fatty liver disease; atherosclerosis; diabetes; insulin resistance; obesity; drug screening; alcoholism; retinal degeneration; hypertension; vascular disease;
                                                           Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                    The present invention describes a method (M1) for designing capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human PD-ATP-binding cassette (PD-ABC) cDNA reverse PCR primer #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

```
The sequence represents a PCR primer used for isolation of cDNA encoding human PD-ATP-binding cassette (PD-ABG) protein. PD-ABC maps to chromosome 19913.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary artery disease, Tangler's disease, faitlal high-density lipoprotein deficiency, atherosciencis, diabetes, fatty liver disease, insulin resistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences
                                                                                                                                                                                             New Human PD-ABC DNA molecules and proteins for diagnosis and treatment of dyslipidaemia, epilepsy and diseases related to abnormal calcium flux

The present limenton destribes a method (M1) for designing capture oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents (I) for capture and harrow range. The method is useful for detecting infectious diseases acused by bacterial infectious agents (I) for cryptococcus neoformans, Candida albicans and Aspergillus funiquetus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents companies of the properties of the prope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                 oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and
                                                                                                                                                                                                                                         Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papiliomavirus types 16 and 18 and 11ver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the
                                                                                                                                              Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents eslected from Onchoverva volvulus, Entanoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a PCR primer used to amplify Pseudomonas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human pathogen; virulence polypeptide; virulence factor;
pathogenic infection; Pseudomonas aeruginosa infection; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                     present invention describes a method (M1) for designing capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primer used to amplify a 1659 bp fragment containing ORF1

These sequences are all ligands specific for fibrin clots identified using the method of the invention. The method of the invention is for identifying nucleic acid (NA) ligands and NA ligand sequences to a tissue target selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ligand; peripheral blood mononuclear cell; fibrin clot; carotid artery; systematic evolution of ligands by exponential enrichment method; PBMC; epitope; macromolecule; tissue SELEX method; cancer screening; therapy; AIDS monitoring; localisation of thrombi; atherosclerosis; ss.
aeruginosa nucleic acid sequences, in the course of the invention. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection.
                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid ligands used in cancer screening, AIDS monitoring etc. - bind to peripheral blood mononuclear cells, fibrin clots or

from peripheral blood mononuciear cells (PBMC'S) (such as the ligands represented by AA770584-T70516), fibrin clots (such as the ligands represented by AA770514-T70704), and carotid arteries (such as these ligands). The method comprises preparing a candidate mixture of NA sequences, and contacting these with the tissue, whereby NAs having an increased affinity to the tissue relative to the candidate mixture may be partitioned from the remainder of the candidate mixture. The increased affinity NAs are then partitioned from the remainder of the candidate mixture, and are amplified to yield a mixture of NAs enriched for NA sequences with a relatively higher affinity and specificity for binding to the tissue, whereby NA ligands of the tissue may be identified. The method represents a tissue SELEX (systematic evolution of ligands by exponential enrichment) method. The NA ligands and epitopes and macromolecules identified using the ligands can be used in diagnostic
                                                                                                                                                                                                                                                                                     and therapeutic applications. In particular, they can be used for e.g. cancer screening, AIDS monitoring, detection and localisation of thrombi or atherosclerosis diagnosis and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3 '-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the

3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented coNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monocytes were prepared from blood by ficoll-hypaque, Monocytes were prepared from blood by ficoll-hypaque, Monocytes were prepared from blood by ficoll-hypaque, percoll and T cell rosetting purification steps (purity: 96 %). mRNA was prepared from activated monocytes from a patient with rheumatoid arthritis. mRNA was reverse transcribed with MuLV. Using Eco-RI linkers cDNA was cloned into l-gt-11 vector arms. The cDNA library was screened by differential hybidization using radioactively marked ss-cDNA from activated and non-activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens

Human Gene Signature, 3'-directed cDNA sequence. We are not
submitting the same cDNA sequence redundantly to DDBJ since 1993.
For the abundance information of clones with this sequence in this
library and as well as in other 3'-directed libraries, see '
http://www.incb.osaka-u.ac.jp/bodymap'. The sequences of the clones
represented by this GS sequences is also found there.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (http://www.fax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase are the polymerase are seen adaptored Unit and a size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pw042 (gil4732114)pb/AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AA931624 37 bp mRNA linear EST 24-APR-1998 0035b08.sl NCI_CGAP_Lu5 Homo sapiens cDNA clone IMAGE:1568151 3' similar to SW:IBA2_HUMAN Q14657 ITBA2_PROTEIN ;, mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymerase and 74 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gild/32114 lgbl/RT23072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

/not="Organ: lung; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT773 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo."

δ d

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar exces. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwaled (gilf) 14732114 (gbh.Rr129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site www.zmdb.lastate.edu and follow the links for 'RescueMu.' Grid I was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
